

SETTING UP A HENRI STUDIO 2650F1 FOUNTAIN

- 1) Choose a location for your 2650F1 fountain such that the front can be seen and enjoyed while the back side is somewhat hidden but accessible for servicing needs.
- 2) Set up is simple. Place the Light in the front basin and feed the light cord through the hole between the front and back inside the basin, pulling it out the back. (The light may have a barbed fitting underneath. If so, this should be removed to help it sit flat on the fountain floor. Some caulk tape is provided which can be used to affix the light to the basin floor.)
- 3) Set the water Pump in the back of the basin – face down (intake side down) - allowing the cord to drape out the back. Thread the Barbed Adapter into the pump top. Attach the tube to the Barbed Adapter and then to the Elbow above.
- 5) Press the rectangular Foam Diffuser into the top of the waterfall.
- 6) Fill the basin with water. Read your Pump instructions and your Light instructions. Connect the Light cord to the Transformer provided. Then, plug both your Pump and the Light Transformer into a GFCI protected circuit. (Both pump and light can work on the same circuit, drawing less than one amp in total.)

IMPORTANT – WINTER CARE

Winter ice build-up can cause damage to concrete statuary. Follow these tips to reduce winter weathering to your fountain:

- * Disconnect power to pumps and lights.
- * Remove plugs/stoppers in all fountain bowls to open drains and let all moisture out. Keep drains open throughout winter.
- * Cover with a Henri fountain cover. Keep tight and do not let snow or water collect in sagging areas.
- * Do not allow snow or ice to build up on or against the concrete. Remove snow before it turns to ice. Do not use antifreeze, salt or chemical ice removers as these may damage concrete.
